

MCQ

Q1) What will be the output of the following code snippet?

```
def func (a, b): return b if a == 0 else  
func (b % a, a) print (func (30, 75))
```

- a) 10
- b) 20
- c) 15
- d) 0

Answer: c) 15

Q2) Numbers = (4, 7, 19, 2, 89, 45, 72, 22) sorted numbers =
sorted(numbers) even = lambda a: a % 2 == 0 even numbers = filter
(even, sorted numbers) print (type (even numbers))

- e) Int
- f) Filter
- g) List
- h) Tuple

Answer: b) Filter

Q3) As what datatype are the *args stored, when passed into

- a) Tuple
- b) List
- c) Dictionary
- d) none

Answer: a) Tuple

When *args stored, is used in a function definition, it collects any additional positional arguments into a tuple. Therefore, the correct answer is Tuple.

Q4) set1 = {14, 3, 55}

set2 = {82, 49, 62}

set3= {99,22,17}

print (len (set1 + set2 + set3))

- a) 105
- b) 270
- c) 0
- d) Error

Answer: d) Error

Q5) What keyword is used in Python to raise exceptions?

- a) raise
- b) try
- c) go to
- d) except

Answer: a) raise

The raise keyword in Python is used to explicitly raise an exception.

Q6) Which of the following modules need to be imported to handle date time computations in Python?

- a) time date
- b) date
- c) datetime
- d) time

Answer: c) datetime

To handle date and time computations in Python, you need to import the datetime module.

Q7) What will be the output of the following code snippet?

```
print (4**3 + (7 + 5) **(1 + 1))
```

- a) 248
- b) 169
- c) 208
- d) 233

Answer: c) 208 $64+144=208$

Q8) Which of the following functions converts date to corresponding time in Python?

- a) strptime

- b) strftime
- c) both a) and b)
- d) None

Answer: b) strftime

The strftime function in Python is used to convert a date object into a string representing the date, controlled by format codes

Q9) The python tuple is _____ in nature.

- a) mutable
- b) immutable
- c) unchangeable
- d) none

Answer: b) immutable

A Python tuple is an immutable data type, meaning its elements cannot be changed after the tuple is created

Q10) The ____ is a built-in function that returns a range object that consists series of integer numbers, which we can iterate using a for loop.

- A. range()
- B. set()
- C. dictionary{}
- D. None of the mentioned above

Answer: A. range()

The range() function in Python is a built-in function that returns a range object representing a sequence of numbers. It is commonly used for iterating over a sequence of numbers in a for loop

Q11) Amongst which of the following is a function which does not have any name?

- A. Del function
- B. Show function
- C. Lambda function
- D. None of the mentioned above

Answer: C. Lambda function

A lambda function in Python is an anonymous function that can have any number of input parameters but can only have one expression. It is defined using the lambda keyword and doesn't have a name like a regular function

Q12) The module Pickle is used to ____.

- A. Serializing Python object structure
- B. De-serializing Python object structure
- C. Both A and B

D. None of the mentioned above

Answer: C. Both A and B

The pickle module in Python is used for serializing and deserializing Python object structures. Serializing refers to the process of converting a Python object into a byte stream, and deserializing is the reverse process of reconstructing the original object from a byte stream.

Q13) Amongst which of the following is / are the method of convert Python objects for writing data in a binary file?

- A. set() method
- B. dump() method
- C. load() method
- D. None of the mentioned above

Answer: B. dump() method

The dump() method is part of the pickle module in Python and is used to convert Python objects into a binary format and write them to a file. This is commonly used for serialization, especially when saving data structures to a file in a binary format.

Q14) Amongst which of the following is / are the method used to unpickling data from a binary file?

- A. load()
- B. set() method
- C. dump() method
- D. None of the mentioned above

Answer: A. load()

The load() method is used to unpickle data from a binary file that has been compressed. The binary read (rb) mode is used to load the file that is to be loaded. If we want to use the load() method, we can write Store object = load(file object) in our program.

Q15) A text file contains only textual information consisting of ____.

- A. Alphabets
- B. Numbers
- C. Special symbols
- D. All of the mentioned above

Answer: D. All of the mentioned above

A text file can contain a combination of alphabets, numbers, and special symbols. It is a type of file that stores plain text information without any formatting or binary data.

Q16) Which Python code could replace the ellipsis (...) below to get the following output? (Select all that apply.) captains = {

"Enterprise": "Picard",

"Voyager": "Janeway",

```
"Defiant": "Sisko", }
```

```
Enterprise Picard,
```

```
Voyager Janeway
```

```
Defiant Sisko
```

a) for ship, captain in captains.items():

```
print(ship, captain)
```

b) for ship in captains:

```
print(ship, captains[ship])
```

c) for ship in captains:

```
print(ship, captains)
```

d) both a and b

Answer: d) both a and b

Both of these options will produce the specified output: Enterprise Picard, Voyager Janeway Defiant Sisko.

Q17) Which of the following lines of code will create an empty dictionary `captains` named?

a) `captains = {dict}`

b) `type(captains)`

c) `captains.dict()`

d) `captains = {}`

Answer: d) `captains = {}`

This line of code creates an empty dictionary named `captains`. The `{}` syntax is used to denote an empty dictionary in Python

Q18) Now you have your empty dictionary named `captains`. It's time to add some data!

Specifically, you want to add the key-value pairs "Enterprise": "Picard", "Voyager": "Janeway", and "Defiant": "Sisko".

Which of the following code snippets will successfully add these key-value pairs to the existing `captains` dictionary?

a) `captains{"Enterprise" = "Picard"} captains{"Voyager" = "Janeway"}`

```
captains{"Defiant" = "Sisko"}
```

b) `captains["Enterprise"] = "Picard" captains["Voyager"] = "Janeway"`

```
captains["Defiant"] = "Sisko"
```

- c) captains = {
 "Enterprise": "Picard",
 "Voyager": "Janeway",
 "Defiant": "Sisko", }
- d) None of the above

Answer: b) captains["Enterprise"] = "Picard"
captains["Voyager"] = "Janeway" captains["Defiant"] = "Sisko"

Q19) You're really building out the Federation Starfleet now! Here's what you have: captains =
{

"Enterprise": "Picard",

"Voyager": "Janeway",

"Defiant": "Sisko",

"Discovery": "unknown",

} Now, say you want to display the ship and captain names contained in the dictionary, but you also want to provide some additional context. How could you do it?

- a) for item in captains.items():
 print(f"The [ship] is captained by [captain].")
- b) for ship, captain in captains.items():
 print(f"The {ship} is captained by {captain}.")
- c) for captain, ship in captains.items():
 print(f"The {ship} is captained by {captain}.")
- d) All are correct

Answer: b) for ship, captain in captains. Items ():
print (f"The {ship} is captained by {captain}.")

Output: The Enterprise is captained by Picard. The Voyager is captained by Janeway. The Defiant is captained by Sisko. The Discovery is captained by unknown.

Q20) You've created a dictionary, added data, checked for the existence of keys, and iterated over it with a for loop. Now you're ready to delete a key from this dictionary:

`captains = {`

`"Enterprise": "Picard",`

`"Voyager": "Janeway",`

`"Defiant": "Sisko",`

`"Discovery": "unknown",}`

What statement will remove the entry for the `"Discovery"` key?

- e) `del captains`
- f) `captains. Remove ()`
- g) `del captains["Discovery"]`
- h) `captains["Discovery"]. pop ()`

Answer: c) `del captains["Discovery"]`

This statement will remove the entry for the key `"Discovery"` from the captain's dictionary
